

How to use The Molding Genie

1

Place the adhesive strips in the indentations on the rear of The Molding Genie (TMG). Peel the backing from the strips to reveal the adhesive. TMG is now ready to adhere to a clean, dry surface.

2

Locate the desired height of the work to be installed (crown molding, cabinets, doors, etc.) and adhere TMG by pressing it to the surface. Slightly loosen the center Locking Knob to allow for vertical and horizontal movement of TMG.

3

Use the small Micro-Adjust Knob at the bottom of TMG to fine tune the desired height of the work to be installed.

4

Adjust the Angle Lock Plate to the desired angle of the work to be installed. Lock the Angle Lock Plate using the two knobs on either side of TMG.

5

Tighten the center Locking Knob to lock TMG in place. Install your work using appropriate fasteners or tools.

6

Holding TMG firmly, slowly pull one exposed tab of the adhesive strips down until it releases from the surface, then repeat with the other strip. The adhesive strips will stretch significantly before releasing from the wall.

NOTE: If the tabs break before they fully release from the surface, do not pry TMG from the wall as significant damage could occur. Instead, tighten the center Locking Knob, grasp the outside of TMG and twist back and forth until the adhesive strips release.
